

TIMSS 2019 Webinar:

Enhancing learning and teaching of mathematics and science in Hong Kong – A reflection based on the TIMSS 2019 results

Frederick K.S. Leung
Kintoy Professor in Mathematics Education
The University of Hong Kong

23 February 2021

新年快樂

辛丑牛年

Happy Chinese New Year 2021

Outline

1. Introduction: What is TIMSS?
2. Achievement of Hong Kong students in TIMSS 2019
3. (a) Attitudes of Hong Kong students towards mathematics learning
(b) Background information of Hong Kong students
4. How should we interpret TIMSS findings?
5. What can we learn from TIMSS?
(a) Trend in achievement; (b) Gender difference; (c) Achievement in different content and cognitive domains; (d) Relation between background factors and student achievement; (e) Efficiency of the education system; (f) Student attitudes
6. Implications for teaching and learning
(a) Student attitudes; (b) School improvement; (c) Professional development of teachers; (d) Teaching and learning
7. Conclusion

1. What is TIMSS?

TIMSS = Trends in International Mathematics and Science Study

- ❖ Under the auspices of the International Association for the Evaluation of Educational Achievement (IEA)
- ❖ Started in 1995 and repeated every four years: 1999, 2003, 2007, 2011, 2015, 2019, ...
- ❖ Assesses student achievement in mathematics and science at Grades 4 (Primary 4) and 8 (Secondary 2)

Goals

“The goal of TIMSS is to provide the best policy-relevant information to help improve mathematics and science teaching and learning.”
(TIMSS 2019 Report, p. 3)

TIMSS is NOT a competition!

TIMSS 2019

- ❖ TIMSS 2019 is the 7th cycle of the TIMSS assessments since 1995, so it monitors 24 years of trends in educational achievement and contexts for learning mathematics and science
- ❖ 64 participating countries/regions and 8 benchmarking entities participated in TIMSS 2019
- ❖ 58 countries/regions & 6 benchmarking entities participated in the 4th grade assessment
- ❖ 39 countries/regions & 7 benchmarking entities participated in the 8th grade assessment
- ❖ More than 580,000 Primary 4 and Secondary 2 students were tested worldwide

Curriculum Framework for TIMSS

TIMSS Curriculum Model

Two Dimensions of Assessment

- ❖ TIMSS assessment is organized around two dimensions, a **content dimension** and a **cognitive dimension**
- ❖ A content dimension specifies the content to be assessed & cognitive dimension specifies the thinking processes to be assessed
- ❖ Content domains of mathematics:
 - P4: Number, Measurement & Geometry, Data
 - S2: Number, Algebra, Geometry, Data and Probability
- ❖ Cognitive domains: Knowing, Applying, Reasoning

Mathematics Content and Cognitive Domains in TIMSS 2019

Content Domains for Grade 4

Number (50%)

Measurement and geometry (30%)

Data (20%)

Cognitive Domains for Grades 4

Knowing (40%)

Applying (40%)

Reasoning (20%)

Content Domains for Grade 8

Number (30%)

Algebra (30%)

Geometry (20%)

Data and Probability (20%)

Cognitive Domains for Grades 8

Knowing (35%)

Applying (40%)

Reasoning (25%)

Mathematics Content Domains

Content Domain (Grade 8)

Number (30%)	Integers (10%)
	Fractions and decimals (10%)
	Ratio, proportion, and percent (10%)
Algebra (30%)	Expressions, operations, and equations (20%)
	Relationships and functions (10%)
Geometry (20%)	Geometric shapes and measurements (20%)
Data and probability (20%)	Data (15%)
	Probability (5%)

Cognitive Domain

Cognitive domain (Grade 8)

Knowing (35%)

Recall, recognize, classify/order, compute, retrieve, measure

Applying (40%)

Determine, represent/model, implement

Reasoning (25%)

Analyze, integrate/synthesize, evaluate, draw conclusions, generalize, justify

eTIMSS 2019

- ❖ TIMSS 2019 is transitioning from paper-and-pencil test (paperTIMSS) to computer-based assessment (eTIMSS)
- ❖ Reflect the growing use of digital devices in school and everyday life, and keep pace with an increasing worldwide reliance on digital communication and assessment
- ❖ Capitalize on the benefits of technology to ask students to solve mathematics problems and conduct science investigations in interactive situations
- ❖ Problem Solving and Inquiry tasks (PSIs): simulate real world and laboratory situations where students can integrate and apply process skills and content knowledge to solve mathematics problems and conduct scientific experiments or investigations

Bridge Study

- A substantial percentage of equivalent items were administered to a separate sample of students in the same school following a randomly equivalent groups design
- The “bridge” data form an intermediate link between eTIMSS 2019 and the paper-based data in 2015, and strengthens the validity and interpretability of achievement results based on linking the two modes

Exhibit 6: eTIMSS 2019 International Average Percent Correct on Paper Bridge and eTIMSS Invariant Items

Grade 4	Bridge	eTIMSS	Difference	z- test
Mathematics	53.42 (0.23)	50.77 (0.13)	2.65 (0.26)	B>E (0.05)
Science	51.51 (0.20)	49.69 (0.11)	1.82 (0.23)	B>E (0.05)
Grade 8	Bridge	eTIMSS	Difference	z- test
Mathematics	47.37 (0.33)	43.72 (0.18)	3.66 (0.38)	B>E (0.05)
Science	47.81 (0.27)	45.72 (0.16)	2.09 (0.31)	B>E (0.05)

B>E indicates the bridge students performed significantly higher than the eTIMSS students ($\alpha = 0.05$).

TIMSS 2019 in Hong Kong

- ❖ Hong Kong participated in TIMSS 1995, 1999, 2003, 2007, 2011, 2015 and 2019
- ❖ The Hong Kong samples included students from local and non-local schools
- ❖ 139 primary schools and 136 secondary schools participated in TIMSS 2019 in Hong Kong
- ❖ 2968 Primary 4 students and 3265 Secondary 2 students were tested in eTIMSS
- ❖ Avg. age of Primary 4 students tested: 10.1 years old
- ❖ Avg. age of Secondary 2 students tested: 14.1 years old

Comparisons between eTIMSS & Bridge Study (East Asian Regions)

eTIMSS 2019 vs Bridge 2019
(Secondary 2)

Mathematics	eTIMSS		Bridge		Significant?
	Scale scores	s.e.	Scale scores	s.e.

International Benchmark - Grade 8

4 levels of International Benchmarks: Advanced (625), High (550), Intermediate (475) and Low (400)

❖ Summary of the four levels of benchmarks:

Low International Benchmark

400

Students have some knowledge of whole numbers and basic graphs.

Intermediate International Benchmark

475

Students can apply basic mathematical knowledge in a variety of situations. They can solve problems involving whole numbers, negative numbers, fractions, decimals, and ratios. Students have some basic knowledge about properties of two-dimensional shapes. They can read and interpret data in graphs and have some rudimentary knowledge of probability.

❖ It can be considered a level of minimum proficiency internationally. Many countries had > 90% of their students reaching the Low Benchmark.

The University of Hong Kong
香港大學教育學院

IEA

*Policy*²¹
政策二十一

Grade 8 – International Benchmark

High International Benchmark

550

Students can apply their understanding and knowledge in a variety of relatively complex situations. They can solve problems with fractions, decimals, ratios, and proportions. Students at this level show basic procedural knowledge related to algebraic expressions and equations. They can solve a variety of problems with angles, including problems involving triangles, parallel lines, rectangles, and congruent and similar figures. Students can interpret data in a variety of graphs and solve simple problems involving outcomes and probabilities.

Advanced International Benchmark

625

Students can apply and reason in a variety of problem situations, solve linear equations, and make generalizations. They can solve a variety of fraction, proportion, and percent problems and justify their conclusions. They can understand linear functions and algebraic expressions. Students can use their knowledge of geometric figures to solve a wide range of problems involving angles, area, and surface area. They can calculate means and medians, and understand how changing data points can impact the mean. Students can interpret a wide variety of data displays to draw and justify conclusions, and solve multistep problems. They can solve problems involving expected values.

Grade 8 – International Benchmark

❖ Low International Benchmark (400)

No items at the eighth grade anchored at the Low level in TIMSS 2019. However, TIMSS 2015 indicated that students at this level have an elementary understanding of whole numbers. They could match tables to bar graphs and pictographs.

❖ Example of a Low Benchmark Item (from T15) – Grade 8

Country	Percent Correct
² Singapore	96 (0.6) 🏆
Hong Kong SAR	95 (0.9) 🏆
Korea, Rep. of	95 (0.9) 🏆
Chinese Taipei	95 (0.9) 🏆
Japan	93 (1.1) 🏆
England	92 (1.2) 🏆

April	60

Grade 8 – International Benchmark

❖ Intermediate International Benchmark (475)

Students at this level can solve problems involving whole numbers, negative numbers, fractions, decimals, and ratios.

Students have some basic knowledge about properties of two-dimensional shapes.

Students can read and interpret data presented in tables, bar graphs, and line graphs. They have some rudimentary knowledge of probability.

Grade 8 – International Benchmark

❖ High International Benchmark (550)

Students can solve problems with fractions, decimals, ratios, and proportions.

Students at this level show basic procedural knowledge related to algebraic expressions. They can simplify expressions with integers. They can evaluate a variety of expressions and formulas, including those with exponents. They can identify algebraic expressions that represent real world situations. Students can identify the solutions of linear equations, a pair of simultaneous linear equations in two variables, and identify the values that satisfy two inequalities. They can determine a specific term of a numerical or geometric pattern.

Students can solve a variety of problems with angles, including problems involving triangles, parallel lines, rectangles, and congruent and similar figures. They can identify points in the Cartesian plane to draw lines and shapes. They can visualize rectangular solids.

Students can interpret data from pie charts, line graphs, and bar graphs to solve problems and provide explanations. They can calculate means. They can solve simple problems involving outcomes and probabilities.

Content Domain: Algebra

Cognitive Domain: Applying

Description: Solves a word problem involving evaluating a formula with exponents

The stopping distance (d) meters depends on the speed (v) meters per second of the car when the brakes are applied. A formula for calculating this distance is:

$$d = \frac{2v + v^2}{20}$$

What is the stopping distance when $v = 20$?

$d =$ m

The answer shown illustrates the type of response that would receive full credit (1 point).

Grade 8 – International Benchmark

❖ Advanced International Benchmark (625)

Students can solve a variety of fraction, proportion, and percent problems and justify their conclusions. They can reason with different representations of numbers in abstract and multistep problems.

Students can construct and solve linear equations in one or two variables. They can identify properties of linear functions from tables, graphs, and equations, including slopes and y -intercepts. Students can express generalizations either algebraically or in words, such as expressing the n^{th} term in number patterns. They can simplify algebraic expressions.

Students can use their knowledge of geometric figures to solve a wide range of problems. They can solve a variety of problems about area and surface area, and use the Pythagorean theorem to find the side length of a triangle. Students can use their knowledge of the relationships between geometric figures, parallel lines, and angles to solve problems on the coordinate plane.

Students can calculate means and medians, and understand how changing data points can impact the mean. Students can interpret a wide variety of data displays to draw and justify conclusions, and solve multi-step problems. They can solve problems involving expected values.

4. How Should We Interpret TIMSS Findings?

e.g., Which policy matters? Which factors impact achievement?

- ❖ E.g., does class size contribute to student achievement?
- ❖ It is extremely difficult for this question to be answered by an educational experiment – random assignment of students to “experimental” and “control” group
- ❖ Question best answered by international studies such as TIMSS
- ❖ What do the results tell us?
(Use TIMSS 2007 maths results as an example)

Class Size

Class Size and Achievement (Grade 8)

	% of students (s.e.)
1-19 students	11 (2.6)
20-32 students	65 (3.9)
33 or more students	24 (3.3)

Has a relation been established between class size and student achievement according to the data?

- ❖ For many countries (e.g., Austria, Italy), class size does not make any difference to student achievement
- ❖ For some countries (e.g., Armenia, Kuwait), the smaller the class size, the higher the student achievement
- ❖ For the majority of the countries (e.g., Chinese Taipei, Colombia, New Zealand), the bigger the class size, the higher the student achievement
- ❖ All the high achieving countries (e.g., Singapore, Korea, Hong Kong) have large class sizes
- ❖ How do these results guide “**educational decision making and practice**”?
- ❖ Are we going to suggest increasing class size in order to raise the achievement of students??

Comparability Problems

- ❖ Sample: grade or age? What is grade 8? Is comparing 15 year olds around the world “fair”?
- ❖ System differences: e.g., application of decimals in currencies problems (the use of “zed” in TIMSS)
- ❖ Language
 - Equivalence in the translation of instruments (TIMSS involves more than 60 countries operating in more than 30 languages; some items become meaningless after translation (e.g., “How many sides are there in a heptagon?”))
 - Does language affect the way we process mathematics in the test matter?

The Root of the Problem

- ❖ In TIMSS, we compare across cultures, using the world as “a natural educational laboratory”
- ❖ Many variables within a country or culture are uniform and cannot be manipulated, and to study the impact of those variables on student achievement, we have to collect data in different cultures, where the variables differ
- ❖ But not only are those variables of interest differ, a host of other variables are vastly different as well, and usually these variables exist as a bundle
- ❖ So it is difficult, if not impossible, to control for all the other variables in studying the variables of interest
- ❖ And we are never sure whether we have taken all relevant variables into account
- ❖ Husen (1983): in international studies, “**we are comparing the incomparables**”!

So Is It Legitimate to Rank Countries?

- ❖ Rigorous methodology adopted in TIMSS means that results on student achievement rather reliable
- ❖ So methodologically speaking, the data of these studies do allow us to rank countries
- ❖ But we need to be careful in interpreting rankings
- ❖ Participating countries in TIMSS change from one cycle to another, so a rank of say 20th in a certain cycle may not mean the same thing as a rank of 20th in another cycle
- ❖ Also, when comparing the relatively rankings between two countries, we should take the standard error of measurement into consideration

Exhibit 3.1: Average Mathematics Achievement and Scale Score Distributions

e.g., Singapore TIMSS 2003 and 2007

- ❖ Compared to TIMSS 2003, grade 8 students in Singapore may be seen as “dropping” from the first place to the third place in TIMSS 2007
- ❖ But if we take the standard errors of measurement into consideration, the differences between the score for Singapore and those of Korea (rank 2) and Chinese Taipei (rank 1) in 2007 are not statistically significant
- ❖ From a statistical point of view, we cannot say that the scores of Chinese Taipei and Korea are higher than that of Singapore
- ❖ So we should not be too sensitive about fine changes in ranking from cycle to cycle - it is usually not too meaningful to say that a country's ranking has dropped from say 15th to 18th without further qualification

Exhibit 1.1 TIMSS 2007 Distribution of Mathematics Achievement (Continued)

Can We Draw Causal Relations?

- ❖ **TIMSS is a survey, and not an experiment**
- ❖ So we have to be extra cautious in drawing conclusions about causal relations
- ❖ In most instances, the best that we can conclude is that a certain variable A ***may*** have caused or impacted student achievement, based on the correlations between the measure of variable A and the achievement scores, since it is unlikely or illogical that achievement leads to changes in variable A
- ❖ But we cannot rule out the possibility that there is a third “hidden” variable which influences both variable A and achievement, causing variable A and achievement to be correlated with each other
- ❖ And there are so many possible variables that may have influenced both variable A and achievement!

Examples:

(1) Class size and achievement

Does big class size lead to high achievement, or are there variables which lead to both large class size and high achievement?

(2) The relation between amount of homework and achievement

Students may have better achievement because they do more homework, but students may need to do more homework because they have low achievement

It is therefore not surprising that there is no clear relationship between student achievement and the amount of homework students do.

5. What Can We Learn from These Studies?

- ❖ Despite all the limitations of TIMSS mentioned above, the rigorous methodologies adopted in these studies do provide us with a reliable measure of student achievement, and hence “effectiveness” of an education system
- ❖ Since these studies are “international (studies) with endorsement from a large number of countries”, they provide benchmarks against which countries may measure the achievement of their students
- ❖ What can we learn from these studies?

5(a) Trend of Student Achievements

- ❖ For those countries which have participated in more than one cycle of TIMSS, it is instructive to look at the change of scores (rather than change of ranking) across different cycles
- ❖ Scores in TIMSS are standardized across years and are thus theoretically comparable
- ❖ But these are not truly longitudinal studies
- ❖ E.g., when the scores of TIMSS 2015 grade 4 students in a certain country are compared to the TIMSS 2019 grade 8 students, the students come from the same cohort but not the same students were taking the tests, so any “gain” in scores only gives rough indication of “trends”
- ❖ Notwithstanding this limitation, this rough information on trends of performance should be informative to educators in the country, especially when there are major curriculum changes taking place in between the cycles of study

Gender and Achievement (S2 maths)

TIMSS 2019
No significant difference

5(c) Comparison of Performance in Different Strands and Areas of the Curriculum

- ❖ Performance in different strands of mathematics (content strand, e.g., geometry versus statistics; cognitive domain, e.g., reasoning versus knowing), will inform us of the relative strengths and weaknesses of our students in light of the performance of students in another country or internationally
- ❖ Hong Kong S2 students are not doing too well in the domain of “Data Display”
- ❖ As Statistics is becoming more important in the contemporary world, it is important to lay a solid foundation on the basic concepts of Statistics from the early stages

Performance of Hong Kong students in Mathematics Content and Cognitive Domains 2019

	Number	Algebra	Geometry	Data and Probability
Grade 8				
HKSAR	570	584	596	563

	Knowing	Applying	Reasoning
HKSAR	580	575	582

5(f) Attitudes of Students towards Mathematics and Learning

- ❖ Students' attitudes are an important component of the attained curriculum, since in all school systems, students' positive attitudes are one of the goals of education
- ❖ In this era when life-long learning is so much stressed, some people think that a positive attitude is even more important than attaining high test scores
- ❖ A positive attitude will motivate students to continue to learn even after they have left school
- ❖ So we should care about students' attitude towards learning, not just their achievement

Grade 8: Students Like Learning Mathematics (international average = 20%)

Grade 8: Students Confident in Mathematics

(international average = 15%)

Grade 8: Students Value Mathematics (international average = 37%)

Secondary 2 Students Value Mathematics Scale

Attitudes of Students from Grade 4 to Grade 8

	Primary 4 (HKSAR %)			Secondary 2 (HKSAR %)
Students Very Much Like Learning Mathematics	35%		➡	15%
Students Very Confident in Mathematics	19%		➡	10%
Students Strongly Value Mathematics	N.A.			19%

- ❖ TIMSS 2019 Primary 4 students generally like learning mathematics more than Secondary 2 students
- ❖ They are also more confident in learning mathematics than Secondary 2 students

What Price Have Hong Kong Paid for High Achievement?

Students' physical health?

Students' interest and development of hobbies?

Students' enjoyment of school life?

Students' enjoyment of family life?

6. Implication of TIMSS for Teaching and Learning

6(a) What can teachers do to inculcate students' positive attitudes?

- ❖ Students might not have realized the importance of mathematics in their everyday life and future career
- ❖ Although students might do well already, they feel that they have not met the expectations of schools/teachers/parents
- ❖ What can be done?
 - Encouragement and positive feedback
 - Let students know about the need of mathematics in different jobs

6(b) How to Use TIMSS Data for School Improvement

School report

國際數學與科學趨勢研究(TIMSS) 2019
學校報告：整體數理成績表現

數學科

學校名稱：[REDACTED]
班別：2018-19 學年中二年級 2C 班
聯絡老師：[REDACTED]

(學校編號：[REDACTED])
(班級編號：[REDACTED])

第一部份：貴校參與學生整體表現

	數學科 整體表現	學科範疇*				認知範疇*		
		數	代數	幾何	數據與 概率	知識	應用	推理
TIMSS 2019 香港參與學校 的平均水平	578	570	584	596	563	580	575	582
貴校參與班別 的平均表現	599	587	596	620	611	602	602	600

*TIMSS 測試結構分兩個範疇：學科範疇 (Content Dimension) 和認知範疇 (Cognitive Dimension)。

學科範疇是針對數學科和科學科裡不同領域 (Domains) 的評估，而認知範疇則觀察學生在處理學科題目時的思考過程。每一條題目包含一個學科領域和一個認知領域。

數學科的學科領域 (Content Domains of Mathematics) :

- 數 (Number)
- 代數 (Algebra)
- 幾何 (Geometry)
- 數據與概率 (Data and Probability)

數學科的認知領域 (Cognitive Domains of Mathematics) :

- 知識 (Knowing) – 學生對數學事實 (facts)、概念 (concepts)、工具 (tools) 和步驟 (procedures) 的知識
- 應用 (Applying) – 在處理問題時，學生運用知識和概念理解 (conceptual understanding) 的能力
- 推理 (Reasoning) – 超越學科上的常規問題 (routine problems)，學生解答複雜 (complex)、不常見 (unfamiliar) 和多重步驟 (multi-step) 的難題

* 「國際數學與科學趨勢研究 2019」的數學科量尺平均分數 (TIMSS Scale Average) 為 500, 標準差為 100。

School report

Trends in International Mathematics and Science Study (TIMSS) 2019 School Report: Overall Mathematics and Science Performance

Mathematics

School: [REDACTED]
Class: 2A to 2E Overall (2018-19 School Year)
School Coordinator: [REDACTED]

(School ID: [REDACTED])
(Class ID: Overall)

Part I: Overall Performance of the Students in the Sampled Class

	Overall Mathematics Performance	Content Domains*				Cognitive Domains*		
		Number	Algebra	Geometry	Data and Probability	Knowing	Applying	Reasoning
Performance of all the participating schools in Hong Kong	578	570	584	596	563	580	575	582
Performance of the sampled students in your school	552	546	563	573	507	555	545	557

*TIMSS assessment is organized around two dimensions, a content dimension and a cognitive dimension. The content dimension specifies the subject matter or content domains to be assessed in mathematics. The cognitive dimension specifies the thinking processes that students are likely to use as they engage with the content. Each item is associated with one content domain and one cognitive domain.

Content Domains of Mathematics:

- Number
- Algebra
- Geometry
- Data and Probability

Cognitive Domains of Mathematics:

- Knowing – refers to student's knowledge base of mathematics facts, concepts, tools, and procedures
- Applying – focuses on the student's ability to apply knowledge and conceptual understanding in a problem situation
- Reasoning – goes beyond the solution of routine problems to encompass unfamiliar situations, complex contexts, and multi-steps problems

* “Trends in International Mathematics and Science (TIMSS) 2019” has a scale average of 500 and a standard deviation of 100.

6(c) Use of the Item Scores for Professional Development of Teachers

Grade 8 Example:

Do you think the following item is difficult for Hong Kong students?

M02_06

Janet described the graph of a function:

- The graph is a straight line.
- The graph intercepts the y -axis at 3.

Which could be the function of Janet's graph?

- (A) $y = x^2 + 3$
- (B) $y = 3x + 1$
- (C) $y = 3x^2 - 1$
- (D) $y = x + 3$

Algebra/Applying (M02_06)

	A	B	C	D	OMITTED	NOT REACHED	GIRLS	BOYS
HONG KONG	11.1	25.8	25.0	33.6	4.2	0.3	30.5	36.4
CHINESE TAIPEI	10.4	21.6	10.2	55.8	2.0	0.0	61.6	50.3
JAPAN	3.7	20.1	7.2	66.3	1.9	0.8	66.0	66.5
KOREA	4.7	19.1	11.4	63.0	1.3	0.6	63.8	62.4
SINGAPORE	11.4	18.1	9.6	58.5	1.6	0.7	64.2	53.4
INT'L AVG	10.2	23.6	15.1	42.2	7.3	1.6	44.4	40.0

❖ HK < Chinese Taipei, Japan, Korea, Singapore and Int'l Avg.

Discussion on Item M02_06

- ❖ Why did Hong Kong students do relatively poorer in this item?
- ❖ What weaknesses and misconceptions are reflected in the performance?
- ❖ What teaching-learning strategies would you suggest other teachers to adopt in order to avoid these weaknesses and misconceptions?

1

Which point shows $\frac{5}{12}$ on the number line?

DIFF = Percent correct; V1 = Percent scoring 1 pt or better; V2 = Percent scoring 2 pts

Percent right for boys and girls corresponds to percent obtaining full credit.

Because of missing gender information, some totals may appear inconsistent.

6(d) How TIMSS Informs Teaching and Learning

Two-digit Diagnostic Codes

- ❖ In the scoring of open-ended items of the TIMSS test, a two-digit scoring code is used, the first digit records the marks given to that item (partial correct answers are reflected by the marks awarded), while the second digit categories how the student arrives at the right or wrong answer
- ❖ The second digit will inform us of the typical way the item is solved in a country or a school, and more importantly typical misconceptions concerning that item
- ❖ These are extremely useful information for teachers

Two-digit Diagnostic Codes

❖ Example: M01_14 (Data and Chance / Reasoning)

M01_14

A salesman looked at the graph showing his sales of books for the first 6 months of 2004, and said, “In March, I sold four times as many books as I sold in February.”

Explain whether you agree or disagree with the salesman, and give a reason.

Note: Code 10 takes precedence over other correct explanation (code 11 and code 12).
Code 11 takes precedence over code 12.

Code	Response	Item: M042164
Correct Response		
10	Disagree, with reference to false origin or scale not starting from zero <i>Examples:</i> <i>I disagree because the graph section of the number of books does not start at zero.</i> <i>I disagree with the salesman. He should look at the graph carefully. The graph is plotted using 900 as the base and not 0.</i>	
11	Disagree with explanation based on multiplication or division <i>Examples:</i> <i>I disagree because I do not think that 940 is 4 times as many. I think if it is 4 times as many it would be 3640.</i> <i>Disagree. As the graph shows that he sold 910 books in February and 940 books in March. 940 is not 4 times of 910.</i> <i>I disagree because if you divide March's total by 4 ($940 \div 4$), you get 235, which is not February's total. February's total was 910</i>	
12	Disagree, with explanation that the increase cannot be 4 times as many books. <i>Example:</i> <i>I disagree because he only sold 30 more books in March. From 910 books he went to 940.</i>	
Incorrect Response		
70	Agree or disagree, with explanation based on only relative heights of the bars shown <i>Examples:</i> <i>I agree because the graph shows that in March the bar went up four times.</i> <i>I disagree as if you look at the bar you will see between February and March there are only three bars, so he would have to say, "In March I sold three times as many books as I did in February."</i>	
79	Other incorrect (including crossed out, erased, stray marks, illegible, or off task) <i>Examples:</i> <i>I agree because in February he sold 30 less book then March.</i> <i>I disagree with the salesman because in February he sold 910 books. That would mean he would have sold 1820 books but he only sold 940 books in March.</i>	
Nonresponse		
99	Blank	

Two-digit Diagnostic Codes

❖ Example: M01_14 (Data and Chance / Reasoning)

	10	11	12	70	79	V1	OMITTE D	NOT REACHED	GIRLS	BOYS
HONG KONG	8.8	53.4	11.2	1.2	20.6	73.5	3.7	1.0	71.9	74.9

Secondary 2 - MP06_04

Block_Seq: MP06_04

Topic	Cognitive Domain	Cognitive Area	Key	Max Pts
2	Reasoning	Evaluate	X	1
Code	Response	Item: M062002		
	Correct Response			
10	13 × 24 OR 24 × 13			
	Incorrect Response			
70	14 × 23 OR 23 × 14			
71	32 × 41 OR 41 × 32 OR 31 × 42 OR 42 × 31 (trying “as large as possible”)			
79	Other incorrect (including crossed out, erased, stray marks, illegible, or off task)			
	Nonresponse			
99	Blank			

7. Conclusion

- ❖ TIMSS is NOT a competition, it's a research study
- ❖ As a large, quantitative cross-national comparative study, it has its limitations
- ❖ The TIMSS research team has tried its best to overcome the limitations in ensuring the accuracy of the data
- ❖ The goal of TIMSS is to provide the best data to help improve mathematics and science teaching and learning
- ❖ But in education, we do not only need data, we also need wisdom!

Coming Soon: TIMSS Workshops for Teachers in December 2021
